

Convert your array class from previous assignment to a template class

- a) (Main) Make an array of size 3 and place 3 Employee objects (Employee class from previous labs). Now resize that array to size 6 using your array resize function and place 3 more employee objects. Show and display data of the 6 Employee's.

- b) Write a function in main called mySort that accepts a templated Array object passed to it by reference. Assume that only integer, float and double arrays will be passed to that function. Re-arrange the elements of that array in ascending order in the same array (Build this logic on your own. It will be useful to come up with it yourself).
